Transfer viva:
Proof-theoretic Semantics for ILL and beyond

Yll Buzoku

University College London

May 30, 2024

Goals for this talk

- To cover the work done in obtaining a proof-theoretic semantics for ILL.
- To highlight some interesting aspects of the results obtained.
- To present an alternative semantics for ILL.
- To discuss my future plans for my PhD.

A natural deduction system for ILL

$$\frac{}{\varphi \vdash \varphi} \text{ Ax}$$

$$\frac{\Gamma, \varphi \vdash \psi}{\Gamma \vdash \varphi \multimap \psi} \multimap\text{-I}$$

$$\frac{\Gamma \vdash \varphi \multimap \psi \quad \Delta \vdash \varphi}{\Gamma, \Delta \vdash \psi} \multimap\text{-E}$$

$$\frac{\Gamma \vdash \varphi \quad \Delta \vdash \psi}{\Gamma, \Delta \vdash \varphi \otimes \psi} \otimes\text{-I}$$

$$\frac{\Gamma \vdash \varphi \otimes \psi \quad \Delta, \varphi, \psi \vdash \chi}{\Gamma, \Delta \vdash \chi} \otimes\text{-E}$$

$$\frac{}{\vdash 1} \text{ 1-I}$$

$$\frac{\Gamma \vdash \varphi \quad \Delta \vdash 1}{\Gamma, \Delta \vdash \varphi} \text{ 1-E}$$

$$\frac{\Gamma \vdash \varphi \quad \Gamma \vdash \psi}{\Gamma \vdash \varphi \mathbin{\&} \psi} \mathbin{\&}\text{-I}$$

$$\frac{\Gamma \vdash \varphi_0 \mathbin{\&} \varphi_1}{\Gamma \vdash \varphi_i} \mathbin{\&}\text{-E}_i$$

$$\frac{\Gamma \vdash \varphi_i}{\Gamma \vdash \varphi_0 \oplus \varphi_1} \oplus\text{-I}_i$$

$$\frac{\Gamma \vdash \varphi \oplus \psi \quad \Delta, \varphi \vdash \chi \quad \Delta, \psi \vdash \chi}{\Gamma, \Delta \vdash \chi} \oplus\text{-E}$$

No 0 intro rule

$$\frac{\Gamma \vdash 0}{\Gamma \vdash \varphi} \text{ 0-E}$$

A natural deduction system for ILL (cont.)

$$\frac{\Gamma_1 \vdash\ !\,\psi_1 \quad \ldots \quad \Gamma_n \vdash\ !\,\psi_n \quad !\,\psi_1, \ldots, !\,\psi_n \vdash \varphi}{\Gamma_1, \ldots, \Gamma_n \vdash\ !\,\varphi} \ !\text{-Promotion}$$

$$\frac{\Gamma \vdash\ !\,\varphi \quad \Delta, \varphi \vdash \psi}{\Gamma, \Delta \vdash \psi} \ !\text{-Dereliction}$$

$$\frac{\Gamma \vdash\ !\,\varphi \quad \Delta \vdash \psi}{\Gamma, \Delta \vdash \psi} \ !\text{-Weakening}$$

$$\frac{\Gamma \vdash\ !\,\varphi \quad \Delta, !\,\varphi, !\,\varphi \vdash \psi}{\Gamma, \Delta \vdash \psi} \ !\text{-Contraction}$$

Alternative systems

- One may consider other natural deduction systems.

Alternative systems

- One may consider other natural deduction systems.
- The exponential has two rules only in the system of Negri:

$$\frac{(!\,\varphi)^m, \Gamma \vdash \chi \qquad \Delta_1 \vdash\, !\,\psi_1 \dots \Delta_n \vdash\, !\,\psi_n \qquad !\,\psi_1, \dots, !\,\psi_n \vdash \varphi}{\Gamma, \Delta_1, \dots \Delta_n \vdash \chi} \text{ !-I}$$

$$\frac{\Gamma \vdash\, !\,\varphi \qquad \Delta, \varphi \vdash \psi}{\Gamma, \Delta \vdash \psi} \text{ !-E}$$

・

Substructural atomic derivability

Definition (Basic rules)

Basic rules take the following form:

$$\{(P_{1_i} \Rightarrow q_{1_i})\}_{i=1}^{l_1}, \ldots, \{(P_{n_i} \Rightarrow q_{n_i})\}_{i=1}^{l_n} \Rightarrow r$$

where

- Each P_i is an atomic multiset, called a premiss multiset.
- Each q_i and r is an atomic proposition.
- Each $(P_i \Rightarrow q_i)$ is a pair (P_i, q_i) called an atomic sequent.
- Each collection $\{(P_{i_1} \Rightarrow q_{i_1}), \ldots, (P_{i_{l_i}} \Rightarrow q_{i_{l_i}})\}$ is called an atomic box.

Substructural atomic derivability

Definition (Basic derivability relation)

The relation of derivability in a base $\mathscr{B}$, is defined inductively as so:

Ref $p \vdash_{\mathscr{B}} p$

App Given that $(\{(P_{1_i} \Rightarrow q_{1_i})\}_{i=1}^{l_1}, \ldots, \{(P_{n_i} \Rightarrow q_{n_i})\}_{i=1}^{l_n} \Rightarrow r) \in \mathscr{B}$ and atomic multisets C_i such that the following hold:

$$C_i \, , P_{i_j} \vdash_{\mathscr{B}} q_{i_j} \text{ for all } i = 1, \ldots, n \text{ and } j = 1, \ldots, l_i$$

Then $C_1 \, , \cdots, C_n \vdash_{\mathscr{B}} r$.

(At)	$\Vdash^L_{\mathscr{B}} p$	iff	$L \vdash_{\mathscr{B}} p$
($-\circ$)	$\Vdash^L_{\mathscr{B}} \varphi -\circ \psi$	iff	$\varphi \Vdash^L_{\mathscr{B}} \psi$
($\otimes$)	$\Vdash^L_{\mathscr{B}} \varphi \otimes \psi$	iff	for any $\mathscr{C}$ such that $\mathscr{B} \subseteq \mathscr{C}$, atomic multisets K and any $p \in \mathrm{A}$, if $\varphi , \psi \Vdash^K_{\mathscr{B}} p$ then $\Vdash^{L,K}_{\mathscr{C}} p$
(1)	$\Vdash^L_{\mathscr{B}} 1$	iff	for any $\mathscr{C}$ such that $\mathscr{B} \subseteq \mathscr{C}$, atomic multisets K and any $p \in \mathrm{A}$, if $\Vdash^K_{\mathscr{B}} p$ then $\Vdash^{L,K}_{\mathscr{C}} p$
($\top$)	$\Vdash^L_{\mathscr{B}} \top$	iff	always
($\&$)	$\Vdash^L_{\mathscr{B}} \varphi \& \psi$	iff	$\Vdash^L_{\mathscr{B}} \varphi$ and $\Vdash^L_{\mathscr{B}} \psi$
($\oplus$)	$\Vdash^L_{\mathscr{B}} \varphi \oplus \psi$	iff	for any $\mathscr{C}$ such that $\mathscr{B} \subseteq \mathscr{C}$, atomic multisets K and any $p \in \mathrm{A}$, if $\varphi \Vdash^K_{\mathscr{C}} p$ and $\psi \Vdash^K_{\mathscr{C}} p$, then $\Vdash^{L,K}_{\mathscr{C}} p$
(0)	$\Vdash^L_{\mathscr{B}} 0$	iff	$\Vdash^L_{\mathscr{B}} p$ for any $p \in \mathrm{A}$
(!)	$\Vdash^L_{\mathscr{B}} !\, \varphi$	iff	for any $\mathscr{C}$ such that $\mathscr{B} \subseteq \mathscr{C}$, atomic multisets K and any $p \in \mathrm{A}$, if for any $\mathscr{D}$ such that $\mathscr{C} \subseteq \mathscr{D}$, (if $\Vdash^{\varnothing}_{\mathscr{D}} \varphi$ then $\Vdash^L_{\mathscr{D}} p$) then $\Vdash^{L,K}_{\mathscr{C}} p$
(,)	$\Vdash^L_{\mathscr{B}} \Gamma , \Delta$	iff	there exists multisets K and M such that $L = K , M$ and $\Vdash^K_{\mathscr{B}} \Gamma$ and $\Vdash^M_{\mathscr{B}} \Delta$
(Inf)	$!\Delta , \Theta \Vdash^L_{\mathscr{B}} \varphi$	iff	for any $\mathscr{C}$ such that $\mathscr{B} \subseteq \mathscr{C}$, atomic multisets K, if $\Vdash^{\varnothing}_{\mathscr{C}} \Delta$ and $\Vdash^K_{\mathscr{C}} \Theta$ then $\Vdash^{L,K}_{\mathscr{C}} \varphi$

Notes on $\Vdash^{L}_{\mathscr{B}}$

- The sequent $\langle \Gamma, \varphi \rangle$ is said to be valid if and only if $\Gamma \Vdash^{\varnothing}_{\varnothing} \varphi$ holds.
- We frequently write this as $\Gamma \Vdash \varphi$.

Notes on $\Vdash^L_{\mathscr{B}}$

- If $\Vdash^L_{\mathscr{B}} \varphi$ then for all $\mathscr{C} \supseteq \mathscr{B}$ we have $\Vdash^L_{\mathscr{C}} \varphi$.

- Given $\Gamma \Vdash^L_{\mathscr{B}} \varphi$ and $\Vdash^K_{\mathscr{B}} \Gamma$, then it holds that $\Vdash^{L,K}_{\mathscr{B}} \varphi$.

Why the extension to Inf?

- Up until now, all Base-extension Semantics have had a simple (Inf) clause.

- For example in IMALL, it suffices to take the following:
  $\Gamma \Vdash^L_{\mathscr{B}} \varphi$ iff for all $\mathscr{C} \supseteq \mathscr{B}$ and K, $\Vdash^K_{\mathscr{C}} \Gamma$ implies $\Vdash^{L,K}_{\mathscr{C}} \varphi$

Why the extension to Inf?

Question: Is this still an inferentialist semantics?

Can we better understand the exponential?

- $!\,\varphi \Vdash \varphi \otimes \ldots \otimes \varphi$
- $\Vdash^L_{\mathscr{B}} !(\varphi \,\&\, \psi)$ iff $\Vdash^L_{\mathscr{B}} !\,\varphi \otimes !\,\psi$

Expanding what we know

$! \varphi \Vdash \varphi \otimes \ldots \otimes \varphi$ iff

for all bases $\mathscr{B}$ and atomic multisets L, such that $\Vdash^{L}_{\mathscr{B}} ! \varphi$ then

$\Vdash^{L}_{\mathscr{B}} \varphi \otimes \ldots \otimes \varphi$

Expanding what we know

- So when does $\Vdash^L_{\mathscr{B}} \varphi \otimes \ldots \otimes \varphi$ hold?

Expanding what we know

Considering the case when $\varphi = p$ for simplicity we get the following:

Expanding what we know

Considering the case when $\varphi = p$ for simplicity we get the following:

- Given a base $\mathscr{B}$ such that $\vdash_{\mathscr{B}} p$ and $L = \varnothing$.

Expanding what we know

Considering the case when $\varphi = p$ for simplicity we get the following:

- Given a base $\mathscr{B}$ such that $\vdash_{\mathscr{B}} p$ and $L = \varnothing$.
- Then we have that $\Vdash^L_{\mathscr{B}} p \otimes \ldots \otimes p$.

Expanding what we know

Considering the case when $\varphi = p$ for simplicity we get the following:

- Given a base $\mathscr{B}$ such that $\vdash_{\mathscr{B}} p$ and $L = \varnothing$.
- Then we have that $\Vdash_{\mathscr{B}}^{L} p \otimes \ldots \otimes p$.
- Examples of such bases:
  - $\mathscr{B} = \{\varnothing \Rightarrow p\}$
  - $\mathscr{B} = \{\varnothing \Rightarrow q,\ q \Rightarrow p\}$

Expanding what we know

Considering the case when $\varphi = p$ for simplicity we get the following:

- Given a base $\mathscr{B}$ such that $\vdash_{\mathscr{B}} p$ and $L = \varnothing$.
- Then we have that $\Vdash_{\mathscr{B}}^{L} p \otimes \ldots \otimes p$.
- Examples of such bases:
  - $\mathscr{B} = \{\varnothing \Rightarrow p\}$
  - $\mathscr{B} = \{\varnothing \Rightarrow q,\ q \Rightarrow p\}$

Note that if $L \neq \varnothing$ then the only way that this relation could hold is if the atoms were derivable from within the base, i.e. if were valid $\Vdash_{\mathscr{B}}^{\varnothing} L$.
So ultimately, $\Vdash_{\mathscr{B}}^{\varnothing} p \otimes \ldots \otimes p$.

Expanding what we know

Inferring from $!\varphi$ should imply that $\Vdash^{\varnothing}_{\mathscr{B}} \varphi$.

A proof-theoretic flavour of the !

We now consider the second identity: $\Vdash^{L}_{\mathscr{B}} !(\varphi \,\&\, \psi)$ iff $\Vdash^{L}_{\mathscr{B}} !\,\varphi \otimes !\,\psi$ with $\psi = \top$. Furthermore since $\varphi \,\&\, \top \equiv \varphi$ we go as follows:

$\Vdash^{L}_{\mathscr{B}} !\,\varphi$ iff $\Vdash^{L}_{\mathscr{B}} !\,\varphi \otimes !\,\top$

  iff for all $\mathscr{C} \supseteq \mathscr{B}$, K and $p \in \mathrm{A}$, $!\,\varphi$, $!\,\top \Vdash^{K}_{\mathscr{C}} p$ implies $\Vdash^{L,K}_{\mathscr{C}} p$

  iff for all $\mathscr{C} \supseteq \mathscr{B}$, K and $p \in \mathrm{A}$,

  if (for all $\mathscr{D} \supseteq \mathscr{C}$, if $\Vdash^{\varnothing}_{\mathscr{D}} \varphi$ and $\Vdash^{\varnothing}_{\mathscr{D}} \top$ then $\Vdash^{K}_{\mathscr{D}} p$) then $\Vdash^{L,K}_{\mathscr{C}} p$

  iff for all $\mathscr{C} \supseteq \mathscr{B}$, K and $p \in \mathrm{A}$,

  if (for all $\mathscr{D} \supseteq \mathscr{C}$, if $\Vdash^{\varnothing}_{\mathscr{D}} \varphi$ then $\Vdash^{K}_{\mathscr{D}} p$) then $\Vdash^{L,K}_{\mathscr{C}}$

Some failed attempts

- The most convincing hypothesis was that $\Vdash^{L}_{\mathscr{B}} \mathop{!} \varphi$ iff $L = \varnothing$ and for all $\mathscr{C} \supseteq \mathscr{B}$, atomic multisets K and atoms p, if $\varphi \Vdash^{K}_{\mathscr{C}} p$ then $\Vdash^{K}_{\mathscr{C}} p$.

Some failed attempts

- The most convincing hypothesis was that $\Vdash_{\mathscr{B}}^{L} \, ! \, \varphi$ iff $L = \varnothing$ and for all $\mathscr{C} \supseteq \mathscr{B}$, atomic multisets K and atoms p, if $\varphi \Vdash_{\mathscr{C}}^{K} p$ then $\Vdash_{\mathscr{C}}^{K} p$.
- This however fails to be complete as it requires us to be able to prove from $L \vdash_{\mathscr{B}} (! \, \varphi)^{\flat}$ that $L = \varnothing$, to pass Proposition 31.

Some failed attempts

- The most convincing hypothesis was that $\Vdash^L_{\mathscr{B}} \, ! \, \varphi$ iff $L = \varnothing$ and for all $\mathscr{C} \supseteq \mathscr{B}$, atomic multisets K and atoms p, if $\varphi \Vdash^K_{\mathscr{C}} p$ then $\Vdash^K_{\mathscr{C}} p$.
- This however fails to be complete as it requires us to be able to prove from $L \vdash_{\mathscr{B}} (! \, \varphi)^\flat$ that $L = \varnothing$, to pass Proposition 31.
- Attempts to generalise this by replacing $L = \varnothing$ with $\Vdash^\varnothing_{\mathscr{B}} L$ fail for the same reason.

The idea of a zoned semantics

- Not absurd to distinguish basic sentences based on whether they are to be used as a hypothesis in an intuitionistic or a resourceful way.

The idea of a zoned semantics

- Not absurd to distinguish basic sentences based on whether they are to be used as a hypothesis in an intuitionistic or a resourceful way.
- Thus we define a new type of basic rule that lookds something like this:

$$
\frac{\begin{array}{ccc} [P_1; C_1] & & [P_n; C_n] \\ \vdots & & \vdots \\ q_1 & \cdots & q_n \end{array}}{r} \; \mathcal{R}
$$

Exploring the zoned semantics

Definition (Zoned basic derivability relation)

The relation of derivability in a base $\mathscr{B}$, is defined inductively as so:

Ref $S; T \vdash_{\mathscr{B}} p$ iff ($p \in S$ and $T = \varnothing$) or $T = [p]$.

App Given that
$(\{(P_{1_i}; C_{1_i} \Rightarrow q_{1_i})\}_{i=1}^{l_1}, \ldots, \{(P_{n_i}; C_{n_i} \Rightarrow q_{n_i})\}_{i=1}^{l_n} \Rightarrow r) \in \mathscr{B}$ and
atomic multisets G and C_i such that the following hold:

$$G, P_{i_j}; L_i, C_{i_j} \vdash_{\mathscr{B}} q_{i_j} \text{ for all } i = 1, \ldots, n \text{ and } j = 1, \ldots, l_i$$

Then $G; L_1, \cdots, L_n \vdash_{\mathscr{B}} r$.

Exploring the zoned semantics

- $\Vdash_{\mathscr{B}}^{G;L} p$ iff $G; L \vdash_{\mathscr{B}} p$

- $\Vdash_{\mathscr{B}}^{G;L} \Gamma , \Delta$ iff there exists $L = U , V$ such that $\Vdash_{\mathscr{B}}^{G;U} \Gamma$ and $\Vdash_{\mathscr{B}}^{G;V} \Delta$

- $\Vdash_{\mathscr{B}}^{G;L} ! \varphi$ iff for every base $\mathscr{C} \supseteq \mathscr{B}$, atomic multisets h, K and atom p, such that $\varphi; \cdot \Vdash_{\mathscr{C}}^{H;K} p$ hold, then $\Vdash_{\mathscr{C}}^{G,H;L,K} p$.

- $\Gamma; \Delta \Vdash_{\mathscr{B}}^{G;L} \varphi$ iff for every $\mathscr{C} \supseteq \mathscr{B}$ and atomic multisets H, K such that $\Vdash_{\mathscr{C}}^{H;\varnothing} \Gamma$ and $\Vdash_{\mathscr{C}}^{G,H;L,K} \Delta$ then $\Vdash_{\mathscr{C}}^{G,H;L,K} \varphi$

Some other work undertaken

- Investigated alternative IPL support relations that are more "resource"-aware.
- Started investigating translations between Sandqvist's semantics for IPL and the semantics presented here for ILL.
- Very recently, I have been working on a Base-extension semantics for Lambek Calculus.

Future directions of work

- Study how rules are generally translated from Sandqvists bases for IPL to the bases I presented here.
- Give a Proof-theoretic Semantics for Classical Linear Logic.
- Similarly, study other similar logics such as DILL, FILL and what happens when we have subexponentials.
- Give a categorical interpretation of the semantics presented herein.
- Investigate the connection to Linear Logic programming.
- Develop a connection to the Kripke semantics of Miller for his fragment of ILL.

Thank you!

Thank you for listening!
